TECMAN Lesson 12

Add a Drawer to a screen

In apps that use Material Design, there are two primary options for navigation: tabs and drawers. When there is insufficient space to support tabs, drawers provide a handy alternative.

In Flutter, use the [Drawer](#) widget in combination with a [Scaffold](#) to create a layout with a Material Design drawer. This recipe uses the following steps:

1. Create a Scaffold.
2. Add a drawer.
3. Populate the drawer with items.
4. Close the drawer programmatically.

1. Create a Scaffold

To add a drawer to the app, wrap it in a [Scaffold](#) widget. The Scaffold widget provides a consistent visual structure to apps that follow the Material Design Guidelines. It also supports special Material Design components, such as Drawers, AppBars, and SnackBars.

In this example, create a Scaffold with a drawer:

```
Scaffold(  
  drawer: // Add a Drawer here in the next step.  
);
```

2. Add a drawer

Now add a drawer to the Scaffold. A drawer can be any widget, but it's often best to use the Drawer widget from the [material library](#), which adheres to the Material Design spec.

```
Scaffold(  
  drawer: Drawer(  
    child: // Populate the Drawer in the next step.  
  )  
);
```

3. Populate the drawer with items

Now that you have a Drawer in place, add content to it. For this example, use a [ListView](#). While you could use a Column widget, ListView is handy because it allows users to scroll through the drawer if the content takes more space than the screen supports.

Populate the ListView with a [DrawerHeader](#) and two [ListTile](#) widgets. For more information on working with Lists, see the [list recipes](#).

3. Populate the drawer with items

```
Drawer(  
  // Add a ListView to the drawer. This ensures the user can scroll  
  // through the options in the drawer if there isn't enough vertical  
  // space to fit everything.  
  child: ListView(  
    // Important: Remove any padding from the ListView.  
    padding: EdgeInsets.zero,  
    children: <Widget>[  
      DrawerHeader(  
        child: Text('Drawer Header'),  
        decoration: BoxDecoration(  
          color: Colors.blue,  
        ),  
      ),  
      ListTile(  
        title: Text('Item 1'),  
        onTap: () {  
          // Update the state of the app.  
          // ...  
        },  
      ),  
      ListTile(  
        title: Text('Item 2'),  
        onTap: () {  
          // Update the state of the app.  
          // ...  
        },  
      ),  
    ],  
  ),  
);
```

4. Close the drawer programmatically

After a user taps an item, you might want to close the drawer. You can do this by using the [Navigator](#).

When a user opens the drawer, Flutter adds the drawer to the navigation stack. Therefore, to close the drawer, call `Navigator.pop(context)`.

```
ListTile(  
  title: Text('Item 1'),  
  onTap: () {  
    // Update the state of the app.  
    // ...  
    // Then close the drawer.  
    Navigator.pop(context);  
  },  
),
```

TECMAN LIMITED 2019

Complete example

```
import {PageType, PageTypeMaterial, PageType} from '@tecmn/page-type';

const pageType = new PageType({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});

const pageTypeMaterial = new PageTypeMaterial({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});

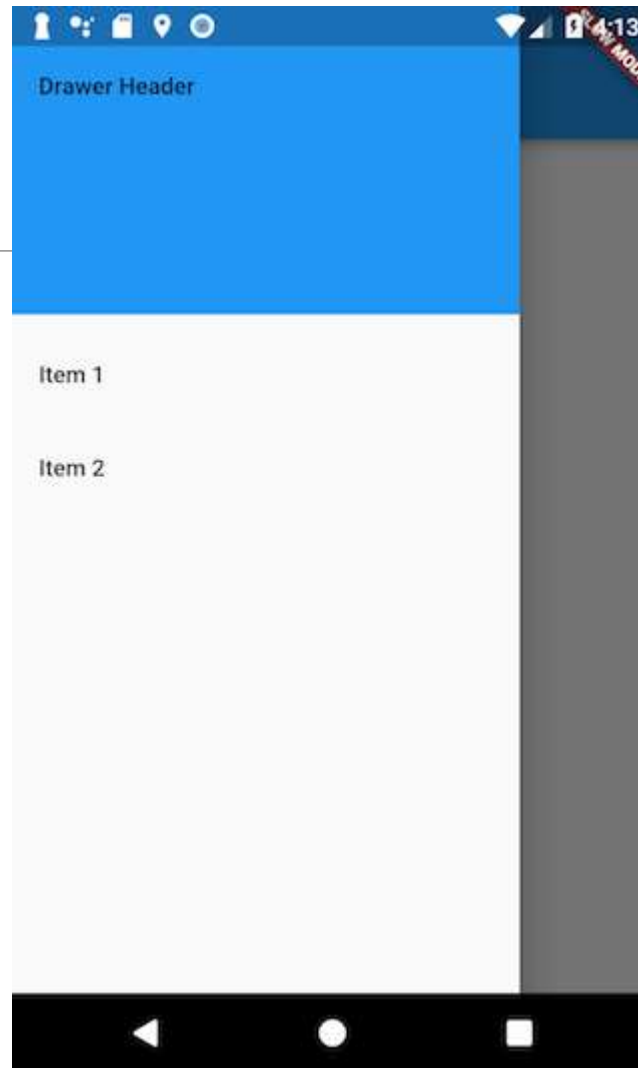

const pageTypePage = new PageTypePage({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});

const pageTypePageMaterial = new PageTypePageMaterial({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});

const pageTypePagePage = new PageTypePagePage({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});

const pageTypePagePageMaterial = new PageTypePagePageMaterial({
  title: 'Page Type',
  subtitle: 'Page Type',
  body: 'Page Type',
  footer: 'Page Type',
});
```
